

Transaction Monitoring Thresholds Policy

Document Code: FRAUD-001 | Version: 3.2 | Effective Date: 01-Apr-2026 | Status: Active

1. Amount-Spike Threshold

A transaction is flagged for amount-spike review when its value exceeds the account's trailing average transaction amount by the following multiples:

1.1 Amount-Spike Bands

Ratio vs. Account Average	Signal Weight
2.5x - 4x	Low (+18 points)
4x - 8x	Medium (+35 points)
8x and above	High (+55 points)

2. Velocity Limits

More than 5 transactions from a single account within any rolling 60-minute window, or more than 15 within a rolling 24-hour window, triggers a velocity flag regardless of individual transaction size.

3. New-Device + High-Amount Combination Rule

A transaction from a device not previously associated with the account, combined with an amount exceeding 3x the account's trailing average, adds +30 points to the transaction's risk score -- this combination is treated as materially higher risk than either signal alone.

4. Odd-Hour Transaction Flagging

Transactions initiated between 1:00 AM and 4:00 AM local time add +20 points to the risk score when combined with any other active signal. An odd-hour transaction with no other signal present is not, by itself, sufficient grounds for review.

5. Channel Risk Weighting

Channel	Baseline Risk Weighting
UPI	Standard
IMPS	Standard
NEFT	Standard
Card - Card Not Present	Elevated (+10 points)
